REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance:

The prior arts fail to teach or fairly suggest a magnetic device as non-volatile memory which also includes a high-speed and low-power method by which a spin polarized electrical current can be used to control and switch the magnetization direction of a magnetic region in such a device. In particular, the improvement consists of having a pinned magnetic layer with a fixed magnetization direction, a free magnetic layer with a free magnetization direction, and a read-out magnetic layer with a fixed magnetization direction. Furthermore, the pinned magnetic layer and the free magnetic layer are separated by a non-magnetic layer, and the free magnetic layer and the read-out magnetic layer are separated by another non-magnetic layer. The magnetization directions of the pinned and free layers generally do not point along the same axis. The non-magnetic layers minimize the magnetic interaction between the magnetic layers. In addition, a current is applied to the device to induce a torque that alters the magnetic state of the device so that it can act as a magnetic memory for writing information. As a result, the resistance, which depends on the magnetic state of the device, can be measured to thereby read out the reformation stored in the memory device.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably
